**Topic: Polynomials and Factoring**

**What Your Student is Learning:** Students will be able to determine if two algebraic expressions that appear to be different can be equivalent. Students will add and subtract polynomial expressions, multiply polynomial expressions, and factor polynomials. They will be able to explain how the properties of real numbers relate to polynomials. Students will use the Commutative and Associative Properties to manipulate polynomial expressions. They will also use the Distributive Property to multiply polynomials and factor polynomials.

**Background and Context for Parents:** Properties of real numbers are used to add and subtract polynomials. Grouping and adding like terms is actually a process of applying the Associative, Commutative and Distributive Properties.

### Adding Polynomials

- \( 8x^2 + (7x + 4x^2) + 2x \)
- \( 8x^2 + (4x^2 + 7x) + 2x \)
- \( (8x^2 + 4x^2) + (7x + 2x) \)
- \( (8 + 4)x^2 + (7 + 2)x \)
- \( 12x^2 + 9x \)

**Subtracting Polynomials**

- \( (5x^2 + 9x) - (2x^2 + 6x) \)
- \( (5x^2 + 9x) + (-2x^2 - (-6x)) \)
- \( 5x^2 + (9x + (-2x^2)) + (-6x) \)
- \( 5x^2 + (-2x^2 + 9x) + (-6x) \)
- \( (5x^2 + (-2x^2)) + (9x + (-6x)) \)
- \( (5 + (-2))x^2 + (9 + (-6))x \)
- \( 3x^2 + 3x \)

**Common Errors When Adding and Subtracting Polynomials**

Students might try to add and subtract exponents, especially if the coefficients of the monomials are 1.

The example below shows this common error:

- \((x^2 + x) + (x^2 + x) = x^3 + x^3 = x^6\) (wrong!)

The correct answer should be

- \((x^2 + x) + (x^2 + x) = 2x^2 + 2x\)

### Multiplying Binomials

The Distributive Property is used to multiply binomials.

- Multiplying a binomial by a monomial uses the Distributive Property.
  - \(5(x + 5)\) Distribute the 5.
  - \((5 \cdot x) + (5 \cdot 5)\)
  - \(5x + 25\)

- Multiplying two binomials uses the Distributive Property.
  - \((3x - 6)(x + 5)\)
  - \((3x - 6)x + (3x - 6)5\)
  - \(3x^2 - 6x + 15x - 30\)
  - \(3x^2 + 9x - 30\)

### Factoring Trinomials

When a number or expression is written in factored form it is written as a product of its factors.

- The factors of 8 are 2 and 4.
- The factors of 8x are 2, 4, and \(x\).
- \(x^2 + x - 12\) can be factored as well. Factoring trinomials, however, is not as simple as the factoring of whole numbers and monomials shown above.

- **x^2 + x - 12**
  - One strategy for factoring trinomials is to start by finding all of the factors of c in the standard form \(ax^2 + bx + c\).
  - In the expression above, \(ac = -12\).
  - Factors of \(-12\) are \(-12, 1; -6, 2; -4, 3; -3, 4; -2, 6; \) and \(-1, 12\).
  - Find the two factors whose sum is \(b\). In the expression above \(b = 1\).
  - The factors to consider are 4 and \(-3\).
  - \(4 + (-3) = 1\)
  - Use these two factors to write two binomials.
  - \(x + 4\) and \(x - 3\)
  - \(x^2 + x - 12\) is the product of these two binomials.
  - \(x^2 + x - 12 = (x + 4)(x - 3)\)

Ways to support your student:
● Students might try to add and subtract exponents, especially if the coefficients of the monomials are 1.

The example below shows this common error:

\[(x^2 + x) + (x^2 + x) = x^3 + x^3 = x^6\]  (wrong)

The correct answer should be:

\[(x^2 + x) + (x^2 + x)\]
\[(x^2 + x^2) + (x + x)\]
\[2x^2 + 2x\]

● When multiplying binomials, students often make mistakes related to the signs of the terms.

An example of this common error is shown below:

\[
\frac{(2x - 6)(5x - 1)}{\overline{10x^2 + 30x + 2x - 6}}\]
\[
\frac{10x^2 + 30x + 2x - 6}{\overline{10x^2 - 32x - 6}}
\]

The underlines indicate where errors were made. The correct answer is \(10x^2 - 32x - 6\).

Online Resources for Students:

Khan Academy:

https://www.khanacademy.org/math/algebra2/x2ec2f6f830c9fb89:poly-factor/x2ec2f6f830c9fb89:common-factor/a/taking-common-factors

Learning Support for Mathematics

For students that are approaching grade level and have learning gaps/ differences in mathematics, provide numerous opportunities for explorations at the concrete (manipulatives) and representational (visual) levels before progressing to the abstract (numbers) level. Students that need learning supports should be provided with:

- Intensive Direct Instruction and daily guided practice
- scaffolded supports
- the use of visuals as models and aids
- numerous opportunities to think out loud
- support to help them understand the why
- use of manipulatives and tools to support understanding
- Bar Modeling Representations to decode word problems
- the use of mnemonics to enhance retention of skills
- daily practice with basic facts
- the presentation of content in varied contexts and varied levels
- opportunities to use diagrams and draw math concepts
- graph paper to support understanding
· numerous opportunities to draw pictures of word problems
· the use of smaller numbers to address number operations
· opportunities for success to build a growth mindset
· computer time to allow for needed practice
· opportunities to engage in metacognition (the building and reinforcing of thinking and reasoning) skills

See examples for each bulleted item below:

· Intensive Direct Instruction and daily guided practice
(Intensive Direct Instruction means to explain the skill / concept to the student with several examples repeatedly to help them understand)

· Scaffolded Supports
(Scaffolded supports means to introduce the skill one step at a time – allowing the student to understand one section part, before moving on to the next part) ex. 5+ 1=6, 9+1=10, 24+1=25- it is the same as “what number comes after 5, after 9, after 24
https://youtu.be/5hWDbSx_kdo

· Visuals as models and aides
(Pictures of objects that can be used to help students understand the math)
https://studentsatthecenterhub.org/resource/helping-struggling-students-build-a-growth-mindset/

· Thinking out loud
(Allows students to talk and think about the skills they are learning, which allows them to better remember the skill)
https://youtu.be/f-4N7OxSMok

· Understanding the why
(When students understand why a strategy works, they will apply it to other skills) ex. 5x = 5, 45x1=45, 320x1=320

· Manipulatives and Tools
(Manipulatives can be counters, beans, blocks, etc. – Tools can be rulers, calculators, scales, etc.) https://youtu.be/uWBZF-Lyq58

· Bar Modeling Representations
Bar Modeling Representations consist of visuals that help students under the skill they are learning. Ex.

<table>
<thead>
<tr>
<th>70</th>
</tr>
</thead>
<tbody>
<tr>
<td>35</td>
</tr>
</tbody>
</table>

https://youtu.be/TbayTZvS_bc

- **Mnemonics**
  (Mnemonics consist of strategies to help students remember skills – ex.

![Mnemonic Devices](https://example.com/mnemonic)

https://youtu.be/dXvvGc9TldY

- **Basic Facts**
  (Basic facts include addition, subtraction, division, multiplication facts – ex. 8+2=10, 2+8=10, 10-2=8, 10-8=2 / 2x5=10, 5x2=10, 10/2=5, 10/5=2

https://youtu.be/TbayTZvS_bc

- **Content with varied contexts and varied levels**
  Means to show student how to solve a problem different ways to allow them to use the skill that way they understand best

https://youtu.be/FVg9n0l0Gf0

- **Diagrams**
  (Diagrams provide students with visuals / pictures that help them solve the problem and they help them read the problem with less words)

https://youtu.be/TbayTZvS_bc

- **Graph paper**
  (Graph paper helps students to solve the problem by making it visual / easier to see the answer)

https://youtu.be/mX43cn3IASI

- **Drawing Pictures**
(Drawing pictures allow students to show they can solve the problem without using words that they may not know or be able to write)
https://youtu.be/TbayTZvS_bc

· **Smaller Numbers**
(The use of smaller numbers can help students understand the process of a skill, so that when they move on to bigger numbers, they will see that the process is still the same, they acquire understanding of the skill)  
ex. 5x = 5, 45x1 = 45, 320x1 = 320

· **Growth Mindset**
(A growth mindset is a process that helps to improve intelligence (thinking), ability (skill) and performance (actions). This means that by helping students to develop a growth mindset, we can help them to learn to think and be problem solvers. This is a process that occurs over time by helping them improve by building success over time.  
https://studentsatthecenterhub.org/resource/helping-struggling-students-build-a-growth-mindset/

· **Computer Time**
(Computer time allows students to use websites, games, activities that will help them learn math skills and concepts)  
mathgametime.com, pbs.com, bestkidsolutions.com, firstinmath.com, helpingkidsrise.org

· **Metacognition**
(Metacognition means to help students think about what they are thinking, the steps they are using, the words and numbers that they are using- It helps students to better focus on the skills they are using- it is a process that occurs over time) /  
https://youtu.be/HKFOhd5sMEc/  
http://www.spencerauthor.com/metacognition/

Choose the concept or concepts from the list above that best represent the item in each box.

1. $2x^3 + 5$
2. $5x + 4x^2$
3. 8

4. 9
5. $3x^2 + 6x + 4$
6. $3x^3 + 6x$

7. $4x^4 + 6x^3 + 2x^2$
8. $7x^2 + x$
9. $5x^3$
8-1 Reteaching
Adding and Subtracting Polynomials

You can add and subtract polynomials by lining up like terms and then adding or subtracting each part separately.

Problem

What is the simplified form of \((3x^2 - 4x + 5) + (5x^2 + 2x - 8)\)?

Write the problem vertically, lining up the like terms.
Then add each pair of like terms.

**Solve**
- Add the \(x^2\) terms: \(3x^2 + 5x^2 = 8x^2\)
- Add the \(x\) terms: \(-4x + 2x = -2x\)
- Add the constant terms: \(5 + (-8) = -3\)

\[
\begin{align*}
3x^2 & - 4x + 5 \\
+5x^2 & + 2x - 8 \\
\hline
8x^2 & - 2x - 3
\end{align*}
\]

Add the sums.

**Check**

Check your solution using subtraction.

\[
\begin{align*}
8x^2 - 5x^2 & = 3x^2 \\
-2x - 2x & = -4x \\
-3 & - (-8) = 5
\end{align*}
\]

Solution: \((3x^2 - 4x + 5) + (5x^2 + 2x - 8) = 8x^2 - 2x - 3\)

Exercises

Simplify.

1. \(5b^2 + 3b + 2b^2 - 5b\)
2. \(3c^2 + 3c + 4c^2 + 2c\)
3. \(4d^2 - 3d + 6 + 2d^3 + 5d - 3\)
4. \(-3e^2 - 5e + 2 + e^2 + 2e - 7\)
5. \(4f^2 + 2f^2 + 5f + 2f^2 - 4f^2 - 3f\)
6. \(5g^3 - 2g^2 + 3g + 42g^3 + 5g^2 - 2g\)

7. \((3h^2 + 5) + (-5h^2 - 3)\)
8. \((2j^2 + 4j - 6) + (4j^2 - 3j - 3)\)
To subtract polynomials, follow the same steps as in addition.

**Problem**

What is the simplified form of $(6x^3 + 4x^2 - 3x) - (2x^3 + 3x^2 - 5x)$?

Write the problem vertically, lining up the like terms.

```
6x^3 + 4x^2 - 3x
-(2x^3 + 3x^2 - 5x)
```

Then subtract each pair of like terms.

```
6x^3 + 4x^2 - 3x
-(2x^3 + 3x^2 - 5x)
-----
4x^3 + x^2 + 2x
```

**Solve**

Subtract the $x^3$ terms. Subtract the $x^2$ terms. Subtract the $x$ terms.

```
6x^3 - 2x^3 = 4x^3
4x^2 - 3x^2 = x^2
-3x - (-5x) = 2x
```

```
6x^3 + 4x^2 - 3x
-(2x^3 + 3x^2 - 5x)
-----
4x^3 + x^2 + 2x
```

Add the differences.

**Check** Check your solution using subtraction.

```
4x^3 + 2x^3 = 6x^3
x^2 + 3x^2 = 4x^2
2x + (-5x) = -3x
```

Solution: $(6x^3 + 4x^2 - 3x) - (2x^3 + 3x^2 - 5x) = 4x^3 + x^2 + 2x$

**Exercises**

Simplify.

9. $4k^2 + 5k$
   $-3k^2 + 2k$

10. $5m^2 + 4m$
    $-(2m^2 + 3m)$

11. $7n^2 + 4n + 9$
    $-(4n^2 + 3n + 5)$

12. $5p^2 + 6p + 4$
    $-(7p^2 + 4p + 8)$

13. $3q^3 + 2q^2 + 7q$
    $-(6q^2 + 4q^2 - 5q)$

14. $2r^3 - 2r^2 + 5r$
    $-(4r^3 + 5r^2 + 3r)$

15. $(6s^2 - 5s) - (-2s^2 + 3s)$

16. $(3w^2 + 6w - 5) - (5w^2 - 4w + 2)$
### Puzzle: Polynomial Search

Adding and Subtracting Polynomials

You will find the answers to the problems below somewhere in the grid. An answer may appear straight across, straight down, or on a diagonal. Circle each problem and answer you find. The first one has been done for you.

- **a.** \(4x^2 + 7x + 9 - (2x^2 + 10x + 4)\)
- **b.** \(x^5 - x^3 - x^2 + 3 + (x^4 - 2x^2 - 2x^2 + 4x - 3)\)
- **c.** \(-2x^4 - x + 3 + (8x^5 + 8x^4 - 3x + 1)\)
- **d.** \(7x^4 - 2x^2 + 5x + 4 - (x^2 - 2x^4 - 6x^3 + 4x)\)
- **e.** \(6x^5 - x^4 + 5x^3 + (3x^5 + 8x^4 - 6x^2 + 3)\)
- **f.** \(x^3 - 3x^3 + 6x^2 + x - (x^4 + 5x^3 - x^2 + x)\)
- **g.** \(-2x^4 - x^2 + 5 - (2x^5 + 3x^4 - 6x^2 + x)\)
- **h.** \(3x^5 - 4x^4 + 3x^3 + 7 + (-4x^4 - 4x^3 - x + 1)\)
- **i.** \(2x^4 + x^3 + x^2 + 6 - (2x^4 + 5x^3 - x^2 + 3x + 7)\)
- **j.** \(-x^4 + 2x^3 + 2x^2 - 1 - (2x^3 + x^2 + x^2 + 5x - 4)\)
- **k.** \(-x^4 + 4x^3 + 6x^2 + 1 + (2x^4 - 4x^3 - x^2 + 3x + 3)\)
- **l.** \(-x^4 - x^3 + x^2 + 2 - (x^4 - 4x^3 + 2x^2 + x - 3)\)

Think About a Plan
Adding and Subtracting Polynomials

Geometry The perimeter of a trapezoid is 39a – 7. Three sides have the following lengths: 9a, 5a + 1, and 17a – 6. What is the length of the fourth side?

Understanding the Problem

1. What is the perimeter of the trapezoid? _______________________

2. What are the lengths of the sides you are given? ________________

3. How many sides does a trapezoid have? _______________________

4. How do you find the perimeter of a trapezoid? _______________________

5. What is the problem asking you to determine? _______________________

Planning the Solution

6. Draw a diagram of the trapezoid and label the information you know.

7. Write an equation that can be used to determine the length of the fourth side.

Getting an Answer

8. Solve your equation to find the length of the fourth side of the trapezoid.
8-1 Practice

Adding and Subtracting Polynomials

Find the degree of each monomial.

1. $2b^2e^3$
2. $5x$
3. $7x^5$
4. $19ab$

5. $12$
6. $\frac{1}{2}z^2$
7. $t$
8. $4d^3e$

Simplify.

9. $2a^2b + 4ab$
10. $5x^3 - 4x^2$
11. $3m^2n^3 - 5m^2n^3$

12. $-6ab + 3ab$
13. $4c^2d^2 - 7c^2d^2$
14. $315x^2 - 30x^2$

Write each polynomial in standard form. Then name each polynomial based on its degree and number of terms.

15. $15x - x^3 + 3$
16. $5x + 2x^2 - x + 3x^4$
17. $9x^5$

18. $7b^2 + 4b$
19. $-3x^2 + 11 + 10x$
20. $12x^2 + 1 - 3x + 8 - 2x$

Simplify.

21. $8z - 12$
22. $9x^3 + 3$
23. $6j^2 - 2j + 5$

+ $6z + 9$
+ $4x^3 + 7$
+ $3j^2 + 4j - 6$

24. $(3k^2 + 5) + (16x^2 + 7)$

25. $(g^4 - 4g^3 + 11) + (-g^3 + 8g)$

26. A local deli kept track of the sandwiches it sold for three months. The polynomials below model the number of sandwiches sold, where $s$ represents days.

Ham and Cheese: $4s^3 - 28s^2 + 33s + 250$
Pastrami: $-7.4s^2 + 32s + 180$

Write a polynomial that models the total number of these sandwiches that were sold.
8-1 Practice (continued)  

Adding and Subtracting Polynomials

Simplify.

27. \[11n - 4 - (5n + 2)\]

28. \[7x^4 + 9 - (8x^4 + 2)\]

29. \[3d^2 + 8d - 2 - (2d^2 - 7d + 6)\]

30. \[(28e^3 + 3e^2) + (19e^3 + e^2)\]

31. \[(-12h^4 + h) - (-6h^4 + 3h^2 - 4h)\]

32. A small town wants to compare the number of students enrolled in public and private schools. The polynomials below show the enrollment for each:

   Public School: \[-19e^2 + 980c + 48,989\]
   Private School: \[40c + 4046\]

   Write a polynomial for how many more students are enrolled in public school than private school.

Simplify. Write each answer in standard form.

33. \[(3a^2 + a + 5) - (2a - 5)\]

34. \[(6d - 10d^2 + 3d^2) - (5d^2 + 3d - 4)\]

35. \[(-4s^2 + 2s - 3) + (-2s^2 + s + 7)\]

36. \[(8p^3 - 6p + 2p^2) + (9p^2 - 5p - 11)\]

37. The fence around a quadrilateral-shaped pasture is \[3a^2 + 15a + 9\] long. Three sides of the fence have the following lengths: \[5a, 10a - 2, a^2 - 7\]. What is the length of the fourth side of the fence?

38. Error Analysis Describe and correct the error in simplifying the sum shown at the right.

\[
\frac{6x^3 + 4x - 10}{3x^3 + 6x - 2}
\]

39. Open-Ended Write three different examples of the sum of a quadratic trinomial and a cubic monomial.
Find the degree of each monomial.
1. $3x^3y$
2. $3n$
3. $5xy^2$
4. $7$
5. $\frac{1}{k^5}$
6. $d$

Simplify.
7. $3m^3 + 6m^n$
8. $12g^5 - 7g^2$
9. $11e^4d + 12e^4d$
10. $42e^3 - 15e^3$

Write each polynomial in standard form. Then name each polynomial based on its degree and number of terms.
11. $7a + 4a^2$
12. $5b^2 + 2n$
13. $11d^3$
14. $2x^3 + 9x + 8 + 4x$

15. A pizza shop owner is monitoring the amount of cheese he uses each week. The polynomials below model the pounds of cheese ordered in the past, where $p$ represents pounds.

- Mozzarella: $3p^3 + 6p^2 + 14p + 125$
- Cheddar: $12.5p^2 + 18p + 75$

Write a polynomial that models the total number of pounds of cheese that were ordered.
8-1 Practice (continued) Form K
Adding and Subtracting Polynomials

Simplify.

16. \( \frac{3x + 5}{7 + 3} \) 
17. \( (t^4 + 4t^2 + 9) + (t^2 + 3t) \)
18. \( \frac{4b^2 + 6}{7b^2} \) 
19. \( 4z + 7 \) 
20. \( (6k^3 + 3k) \times (5k^3 + 3k^2 + 8k) \) 
21. \( 9p^4 + 5 \) 
22. \( 3p^4 + 1 \)

22. A city wants to compare the number of people who own their own home and who rent their home. The polynomials below show expressions for each. In each polynomial, \( p = 0 \) corresponds to the first year.

Own: \( 4p^2 + 360p + 22,178 \)
Rent: \( 6p^2 + 125p + 5286 \)

Write a polynomial for how many more own their home than rent their home.

23. The wallpaper border that runs all the way around a room is \( 5f^2 + 19f + 11 \) long. Three sides of the room have the following lengths of border: \( 6f, 5f, 7, 2f^3 + 2 \). What is the length of the fourth side of the room?

24. Open-Ended Write two different polynomials with a difference of \( 3x^2 + 5x - 7 \).
8-1

Enrichment

Adding and Subtracting Polynomials

Packing boxes and packing sheets in different sizes are given by the expressions below. To find the number of packing boxes and sheets that will fit in a larger shipping box, add or subtract the polynomials. Tell the total number of boxes and sheets. Then tell how many medium and large boxes and sheets you could fit into the shipping box. The first one has been started for you.

<table>
<thead>
<tr>
<th>Boxes</th>

<td></td>
</tr>
</tbody>
</table>

1. $7a^3 + 5b^3 + 5a^3 - 3b^3 = 12a^3 - 2b^3$

   = 12 small boxes and 2 medium boxes
   = 4 medium boxes
   = ______ large box(es)

2. $6a^2 + 3b^2 - 8c^2 + 12b^2 - 2a^2 + 10c^2 = ______________________$

   = ______ small sheets, ______ medium sheets, and ______ large sheets
   = ______ medium sheets and ______ large sheets
   = ______ large sheets

3. $(8a^3 - 3b^3 + 6c^3) - (2a^3 - 14b^3 + 2c^3) = ______________________$

   = ______ small boxes, ______ medium boxes, and ______ large boxes
   = ______ medium boxes and ______ large boxes
   = ______ large boxes

4. $(15c^2 + 12a^3 - 9b^2) + (-14c^2 + 6a^3 + 5b^3 + 25b^2) = ______________________$

   = ______________________

   = ______ medium boxes ______ medium sheets, and ______ large sheets
   = ______ large boxes and ______ large sheets
There are two sets of note cards below that show how Brittany factors the polynomial $5x^5 + 15x^3 + 4x^2$. The set on the left explains the thinking. The set on the right shows the steps. Write the thinking and the steps in the correct order.

**Think Cards**

- Factor each term of the polynomial.
- Simplify.
- Find the GCF of the three terms.
- Factor out the GCF from each term.

**Write Cards**

- $x^2(5x^3 + 15x + 4)$
- The GCF is $x \cdot x$, or $x^2$.
- $5x^5 + 15x^3 + 4x^2 = x^2(5x^3) + x^2(15x) + x^2(4)$
- $5x^5 = 5 \cdot x \cdot x \cdot x \cdot x \cdot x$
- $15x^3 = 3 \cdot 5 \cdot x \cdot x \cdot x$
- $4x^2 = 2 \cdot 2 \cdot x \cdot x$

**Think**

- First, she should
- Second, she should
- Next, she should
- Finally, she should

**Write**

- Step 1
- Step 2
- Step 3
- Step 4
8-2  Reteaching
Multiplying and Factoring

You can multiply a monomial and a trinomial by solving simpler problems. You can use the Distributive Property to make three simpler multiplication problems.

**Problem**

What is the simplified form of \(3x(2x^2 + 4x - 1)\)?

Use the Distributive Property to rewrite the problem as three separate multiplication problems.

\[3x(2x^2 + 4x - 1) = (3x \cdot 2x^2) + (3x \cdot 4x) + (3x \cdot (-1))\]

Remember that when you multiply same-base terms containing exponents, you add the exponents.

**Solve**

- \(3x \cdot 2x^2 = 6x^3\)  
  Multiply inside the first pair of parentheses.
- \(3x \cdot 4x = 12x^2\)  
  Multiply inside the second pair of parentheses.
- \(3x \cdot (-1) = -3x\)  
  Multiply inside the third pair of parentheses.
- \(6x^3 + 12x^2 - 3x\)  
  Add the products.

**Check**

- \(6x^3 + 2x^2 = 3x\)  
  Check your solution using division.
- \(12x^2 + 4x = 3x\)
- \(-3x + (-1) = 3x\)

Solution: \(3x(2x^2 + 4x - 1) = 6x^3 + 12x^2 - 3x\)

**Exercises**

Simplify each product.

1. \(4x(2x - 7)\)
2. \(3y(3y + 4)\)
3. \(2z(2z - 3)\)
4. \(3a(-4a - 6)\)
5. \(6b(3b^2 + 2b - 4)\)
6. \(3c^2(2c^2 - 4c + 3)\)
7. \(-2d(4d^2 + 3d - 2)\)
8. \(5e^2(-3e^2 - 2e - 3)\)
9. \(4f(-3f^3 + 2f^2 + 6)\)
Reteaching (continued)

Multiplying and Factoring

To factor a polynomial, find the greatest common factor (GCF) of the coefficients and constants and also the GCF of the variables.

**Problem**

What is the factored form of \(8x^4 + 12x^3 - 16x\)?

**Solve**

Find the GCF of the coefficients. Use prime factorization.

\[
8 = 2 \cdot 2 \cdot 2 \\
1 = 2 \cdot 3 \\
16 = 2 \cdot 2 \cdot 2 \cdot 2
\]

The GCF of the numbers is 4.

Each term has a variable. Remember, \(x = x^1\).
The GCF is the least exponent.
The GCF of the variables is \(x\).
The GCF is \(4x\).

Factor out the GCF of each term.

\[
4(2x^3 - 3x - 4) \\
4x(2x^3 + 3x - 4)
\]

Combine the GCFs.

**Check**

\[
4x(2x^3 + 3x - 4) = 8x^4 + 12x^3 - 16x
\]

Factor the coefficients.

Check by multiplying.

Solution: The factored form of \(8x^4 + 12x^3 - 16x\) is \(4x(2x^3 + 3x - 4)\).

**Exercises**

Find the GCF of the terms of each polynomial.

10. \(12x^2 - 6x\)  
11. \(4y^2 + 12y + 8\)  
12. \(6z^3 + 15z^2 - 9z\)

Factor each polynomial.

13. \(8a + 10\)  
14. \(12b^2 - 18b\)  
15. \(9c^3 + 12c^2\)

16. \(5d^2 - 10d + 20d\)  
17. \(6e^2 + 10e - 8\)  
18. \(8g^3 - 24g^2 + 16g\)
Puzzle: Getting Back Home

Multiplying and Factoring

- Complete the factorization of each expression below. The first one has been done for you.
- Use the factor in parentheses and the directions at the right to first move right or left, then up or down on the grid. For $3x^2 (-11x + 6)$, you go left 11 units ($-11$) and then up 6 units ($+6$) according to the directions at the right.
- Connect each segment to the next segment as you complete the problems.

1. $-3x^3 + 18x^2 = 3x^2(-11x + 6)$

2. $-26x^4 - 4x^3 - 5x^2 = -x^2(\quad)$

3. $31x^4 + 8x^3 - 5x^2 = x^2(\quad)$

4. $-40x^6 - 35x^4 + 15x^2 = 5x^2(\quad)$

5. $15x^5 - 100x^3 + 35x^2 = 5x^2(\quad)$

6. $36x^7 - 4x^6 + 6x^5 = 2x^5(\quad)$

7. $-28x^6 + 12x^5 - 12x^2 = -4x^2(\quad)$

8. $15x^6 - 24x^5 - 21x^2 = 3x^2(\quad)$

9. $22x^9 - 2x^4 + 18x^3 = 2x^3(\quad)$

10. $11x^9 - 22x^8 - 5x^5 = x^2(\quad)$

Horizontal move/Vertical move

- coefficient of $x$, then constant term
- coefficient of $x^2$, then coefficient of $x$
- coefficient of $x^3$, then coefficient of $x$
- coefficient of $x^4$, then coefficient of $x^3$
- coefficient of $x^5$, then constant term
- coefficient of $x^6$, then coefficient of $x^5$

To get HOME from your end point, move ____ units left/right (circle one) and ____ units up/down (circle one).
Think About a Plan

Multiplying and Factoring

a. Factor $n^2 + n$.

b. Writing Suppose $n$ is an integer. Is $n^2 + n$ always, sometimes, or never an even integer? Justify your answer.

1. Factor out $n$ from the expression.

\[ n \left( \Box + \Box \right) \]

2. What are the two factors?

3. What is an integer?

4. Are $n$ and $n + 1$ consecutive integers? Explain.

5. What do you know about the product of odd and even integers?

\[
\text{EVEN} \times \text{EVEN} = \]

\[
\text{ODD} \times \text{ODD} = \]

\[
\text{EVEN} \times \text{ODD} = \]

\[
\text{ODD} \times \text{EVEN} = \]

6. Out of two consecutive integers, how many are odd?

7. Is the product of consecutive integers odd or even? Explain.

8. $n^2 + n$ is \ \ \ \ \ \ \ \ \ an even integer because

8-3 Reteaching

Multiplying Binomials

You can multiply binomials by using the FOIL method. FOIL stands for First, Outer, Inner, and Last.

**Problem**

What is the simplified form of \((4x + 3)(2x + 6)\)?

Use the FOIL method to simplify the binomial.

**Solve**

- \(4x \cdot 2x = 8x^2\) Multiply the First terms.
- \(4x \cdot 6 = 24x\) Multiply the Outer terms.
- \(3 \cdot 2x = 6x\) Multiply the Inner terms.
- \(3 \cdot 6 = 18\) Multiply the Last terms.
- \(8x^2 + 24x + 6x + 18\) Add the products.
- \(8x^2 + 30x + 18\) Add the like terms.

**Check**

Substitute any number for \(x\). Try \(x = 2\). If the two sides of the equation are equal the simplification may be correct.

\[
(4x+3) (2x+6) = 8x^2 + 30x + 18
\]
\[
(4 \cdot 2+3) (2 \cdot 2 + 6) = (8 \cdot 2^2) + (30 \cdot 2) + 18
\]
\[
(11)(10) = 32 + 60 + 18
\]
\[
110 = 110 \checkmark
\]

Solution: The simplified form of \((4x + 3)(2x + 6)\) is \(8x^2 + 30x + 18\).

**Exercises**

Simplify each product.

1. \((a + 6)(a - 3)\)
2. \((b - 4)(b + 5)\)
3. \((c + 3)(c + 7)\)
4. \((2d + 4)(3d - 2)\)
5. \((4e - 5)(3e + 3)\)
6. \((3f - 2)(2f - 4)\)
7. \((5g + 3)(g - 3)\)
8. \((4h + 4)(2h + 5)\)
9. \((3j - 5)(4j - 3)\)
Reteaching (continued)

8-3

Multiplying Binomials

To multiply a trinomial by a binomial, use the same steps as you would to multiply a 3-digit number by a 2-digit number. Find the partial products for each term of the binomial and then add the like terms of the partial products.

**Problem**

What is the simplified form of \((2x^2 + 3x - 4)(3x + 2)\)?

**Solve**

Start by arranging the polynomials vertically.

Multiply each part of the trinomial by 2.

\[
\begin{align*}
2x^2 & \quad 3x & \quad -4 \\
\underline{\times 3x} & \quad \underline{\times 2} & \quad \underline{-4} \\
6x^2 & \quad 9x & \quad -8
\end{align*}
\]

Multiply each part of the trinomial by 3x.

\[
\begin{align*}
2x^2 & \quad 3x & \quad -4 \\
3x & \quad +2 & \quad -4 \\
\underline{6x^2} & \quad +9x & \quad -12x
\end{align*}
\]

Add the partial products:

\[
6x^2 + 13x^2 - 6x - 8
\]

**Check**

Substitute any number for \(x\). Try \(x = 2\). If the two sides of the equation are equal, the simplification may be correct.

\[
(2x^2 + 3x - 4)(3x + 2) = 6x^2 + 13x^2 - 6x - 8
\]

\[
(8 + 6 - 4)(6 + 2) = 48 + 52 - 12 - 8
\]

80 = 80

Solution: The simplified form of \((2x^2 + 3x - 4)(3x + 2)\) is \(6x^2 + 13x^2 - 6x - 8\).

**Exercises**

Simplify each product.

10. \((w^2 + 3w - 4)(2w + 3)\)  
11. \((x^2 - 8x + 6)(3x - 4)\)

12. \((2y^2 + 4y - 5)(4y + 2)\)  
13. \((3z^2 - 6z + 4)(4z + 1)\)
Puzzle: The Binomial Code

Multiplying Binomials

Multiply the binomials in the tables, then complete the columns to the right. The first one has been done for you. Translate the numbers in the shaded boxes to letters using the code below. Then unscramble the letters to complete the phrase at the bottom of the page.

A → 1  B → 2  C → 3  . . .  X → 24  Y → 25  Z → 26

Think About a Plan

Multiplying Binomials

Geometry The dimensions of a rectangular prism are \( n, n + 7, \) and \( n + 8 \). Use the formula \( V = lwh \) to write a polynomial in standard form for the volume of the prism.

Know

1. What are the dimensions of the rectangular prism? __________, __________, __________

2. What is the formula for the volume of a rectangular prism? __________________________

3. In the volume formula, what do \( l, w, \) and \( h \) represent? __________, __________, __________

4. Explain how to write a polynomial in standard form. __________________________

Need

5. To solve the problem you need to find __________

Plan

6. Draw a diagram of the rectangular prism and label the information you know.

7. Write an expression for the volume of the rectangular prism.

8. Write the volume of the rectangular prism as a polynomial in standard form.
Practice

Multiplying Binomials

Simplify each product using the Distributive Property.

1. \((x + 3)(x + 8)\)  
2. \((y - 4)(y + 7)\)  
3. \((m + 9)(m - 3)\)

4. \((c - 6)(c - 4)\)  
5. \((2r - 5)(r + 3)\)  
6. \((3x + 1)(5x - 3)\)

7. \((d + 2)(4d - 3)\)  
8. \((5t - 1)(3t - 2)\)  
9. \((a + 11)(11a + 1)\)

Simplify each product using a table.

10. \((x + 3)(x - 5)\)  
11. \((a - 2)(a - 13)\)  
12. \((w - 4)(w + 8)\)

13. \((5h - 3)(h + 7)\)  
14. \((x - 3)(2x + 3)\)  
15. \((2p + 1)(6p + 4)\)

Simplify each product using the FOIL method.

16. \((2x - 6)(x + 3)\)  
17. \((n - 5)(3n - 4)\)  
18. \((4p^2 + 2)(3p - 1)\)

19. \((a + 7)(a - 3)\)  
20. \((x + 3)(3x - 2)\)  
21. \((k - 9)(k + 5)\)

22. \((b - 5)(b - 11)\)  
23. \((4m - 1)(m + 4)\)  
24. \((7z + 3)(4z - 6)\)

25. \((2h + 6)(5h - 3)\)  
26. \((3w + 12)(w + 3)\)  
27. \((6c - 2)(9c - 8)\)
28. What is the surface area of the cylinder at the right? Write your answer in simplified form.

29. The radius of a cylindrical popcorn tin is \((3x + 1)\) in. The height of the tin is three times the radius. What is the surface area of the cylinder? Write your answer in simplified form.

30. The radius of a cylindrical tennis ball can is \((2x + 1)\) cm. The height of the tennis ball can is six times the radius. What is the surface area of the cylinder? Write your answer in simplified form.

Simplify each product.

31. \((x + 3)(x^2 - 2x + 4)\)

32. \((k^2 - 5k + 2)(k - 5)\)

33. \((3a^2 + a + 4)(2a - 6)\)

34. \((2x^2 + 2x - 6)(3x - 4)\)

35. \((4g + 5)(2g^2 - 7g + 3)\)

36. \((m^2 - 2m + 7)(3m + 6)\)

37. \((2c + 8)(2c^2 - 4c - 1)\)

38. \((t + 8)(3t^2 + 4t + 5)\)

39. A medical center's rectangular parking lot currently has a length of 30 meters and a width of 20 meters. The center plans to expand both the length and the width of the parking lot by \(2x\) meters. What polynomial in standard form represents the area of the expanded parking lot?

40. Error Analysis Describe and correct the error made in finding the product.

41. Multi Step The height of a painting is twice its width \(x\). You want a 3 inch wide wooden frame for the painting. The area of the frame alone is 216 square inches.

a. Draw a diagram that represents this situation.

b. Write a variable expression for the area of the frame alone.

c. What are the dimensions of the frame?
Simplify each product using the Distributive Property.

1. \((b - 2)(b + 1)\)
2. \((x + 6)(x + 5)\)
3. \((3n + 1)(n - 8)\)
4. \((2t + 7)(t - 5)\)
5. \((y + 3)(y + 7)\)
6. \((b - 6)(b + 3)\)

Simplify each product using a table.

7. \((x + 1)(x - 11)\)
8. \((h + 2)(3h + 5)\)
9. \((8w - 3)(4w + 7)\)
10. \((3c + 13)(13c + 3)\)
11. \((3a + 2)(a - 2)\)
12. \((t + 7)(2t - 4)\)
13. \((3q^2 + 6)(2q - 5)\)
14. \((x + 6)(x - 7)\)
15. \((p + 10)(2p + 5)\)
16. \((j - 12)(j + 11)\)
17. \((3z - 4)(7z - 5)\)
18. \((2m + 11)(6m - 1)\)
19. \((7h + 6)(7h - 6)\)
20. \((3z + 7)(4z - 8)\)
21. \((3t + 5)(3t - 2)\)
22. The radius of a circle is \((7x + 3)\) cm. Write an expression to represent the area of the circle in simplified form.

23. A rectangle has a length of \((x + 2)\) in. and a width of \((2x + 3)\) in. Find an expression that represents the area of the rectangle. Write the expression in simplified form.

**Simplify each product using the FOIL method.**

24. \((x + 4)(x + 6)\)  
25. \((a + 5)(2a + 6)\)  
26. \((6d + 4)(8d - 3)\)

27. \((t + 4)(t + 9)\)  
28. \((n + 8)(2n - 7)\)  
29. \((f + 7)(f + 3)\)

**Simplify each product.**

30. \((c + 4)(c^2 + 3c + 5)\)  
31. \((p^2 + 2p + 5)(p - 7)\)

32. \((4x^2 + 2x + 3)(3x - 8)\)  
33. \((5t^2 + 3t + 11)(6t - 1)\)

34. A community center is expanding the size of its rectangular meeting hall. The hall is currently 300 ft long and 150 ft wide. The center plans to expand both the length and the width of the meeting hall by \(3x\) ft. What polynomial in standard form represents the area of the expanded meeting hall?

35. **Open-Ended** Write a cubic monomial and a fourth-degree trinomial. Then find their product and write it in standard form.
### Enrichment

#### Multiplying Binomials

You can find the volume of irregular figures by dividing the figure into smaller rectangular prisms, finding the volume of each separate figure, and then adding them together. The figure to the right can be divided into two rectangular prisms.

\[
V_1 = (x + 1)(x + 1)(x - 1) \\
= (x^2 + 2x + 1)(x - 1) \\
= x^3 + x^2 - x - 1
\]

Subtract to find the length of Prism 2.

\[
(2x + 3) - (x + 1) = x + 2
\]

\[
V_2 = (x + 2)(x - 1)(2x - 2) \\
= (x^2 + x - 2)(2x - 2) \\
= 2x^3 - 6x + 4
\]

\[
V_{\text{Total}} = (x^3 + x^2 - x - 1) + (2x^3 - 6x + 4) \\
= 3x^3 + x^2 - 7x + 3
\]

You can also find the volume of an irregular figure by finding the volume of the whole figure, as if no pieces were cut away. Next, find the volume of the cut away piece, and then subtract that volume from the whole. Prism 2 is \(x - 3\) taller than Prism 1.

\[
V_{\text{Whole}} = (x - 1)(2x + 3)(2x - 2) = (2x^2 + x - 3)(2x - 2) = 4x^3 - 2x^2 - 8x + 6
\]

\[
V_{\text{Piece}} = (x - 1)(x + 1)(x - 3) = (x^3 - 1)(x - 3) = x^3 - 3x^2 - x + 3
\]

\[
V_{\text{Total}} = (4x^3 - 2x^2 - 8x + 6) - (x^3 - 3x^2 - x + 3) = 3x^3 + x^2 - 7x + 3
\]

What is the volume of each figure? Write your answer as a polynomial in standard form.

1. 

2. 

36
### 8-4 Additional Vocabulary Support

**Multiplying Special Cases**

Use the list below to complete the diagram.

<table>
<thead>
<tr>
<th>The square of a binomial is the square of the first term plus twice the product of the two terms plus the square of the last term.</th>
<th>((x + 3)(x - 3) = x^2 - 3^2 = x^2 - 9)</th>
<th>The product of the sum and difference of the same two terms is the difference of their squares.</th>
</tr>
</thead>
<tbody>
<tr>
<td>((a + b)^2 = a^2 + 2ab + b^2)</td>
<td>((a - b)^2 = a^2 - 2ab + b^2)</td>
<td>((a + b)(a - b) = a^2 - b^2)</td>
</tr>
</tbody>
</table>

![Diagram of the Square of a Binomial and the Product of a Sum and Difference](image-url)
8-4 Reteaching
Multiplying Special Cases

A binomial is squared when it is multiplied by itself. The square of a binomial is the square of the first term plus the twice the product of the two terms plus the square of the last term. This can be expressed as \((a + b)^2 = a^2 + 2ab + b^2\).

**Problem**

What is the simplified form of \((x + 5)^2\)?

Use the rules for squaring a binomial.

**Solve**

\[
\begin{align*}
\text{Solve} & \\
x \cdot x &= x^2 \\
2(5 \cdot x) &= 10x \\
5 \cdot 5 &= 25 \\
\text{So. } (x + 5)^2 &= x^2 + 10x + 25.
\end{align*}
\]

**Check**

\[
\begin{align*}
(x + 5)^2 &= (x + 5)(x + 5) \\
x \cdot x &= x^2 \\
x \cdot 5 &= 5x \\
5 \cdot x &= 5x \\
5 \cdot 5 &= 25 \\
x^2 + 5x + 5x + 25 \\
x^2 + 10x + 25
\end{align*}
\]

Rewrite the binomials.

Multiply the First addends.

Multiply the Outer addends.

Multiply the Inner addends.

Multiply the Last addends.

Add the products.

Combine the like terms.

Solution: The simplified form of \((x + 5)^2\) is \(x^2 + 10x + 25\).

**Exercises**

Simplify each expression.

1. \((a + 7)^2\)  
2. \((b - 4)^2\)  
3. \((2c + 3)^2\)  
4. \((3d - 5)^2\)

5. \((4e + 1)^2\)  
6. \((2f - 6)^2\)  
7. \((g - 10)^2\)  
8. \((5h + 8)^2\)

9. \((3j - 3)^2\)  
10. \((2k + 4)^2\)  
11. \((4m - 2)^2\)  
12. \((3n + 6)^2\)
8-4  
Reteaching (continued)  
Multiplying Special Cases

The product of the sum and the difference of the same two terms produces a pattern that can be expanded algebraically as \((a + b)(a - b) = a^2 - ab + ab - b^2\). The sum of the two \(ab\)-terms is 0. Therefore, \((a + b)(a - b) = a^2 - b^2\). The product is the square of the first term minus the square of the last term.

**Problem**

What is the simplified form of \((2x - 3)(2x + 3)\)?

Use the rules for finding the product of the sum and the difference of the same two terms.

**Solve**

\[
\begin{align*}
2x \cdot 2x &= 4x^2 \\
3 \cdot 3 &= 9
\end{align*}
\]

Square the first term.  
Square the last term.

Remember, the product is the difference of the two squares.

The product is \(4x^2 - 9\).

**Check**

Multiply the binomials using the FOIL Method.

\[
\begin{align*}
2x \cdot 2x &= 4x^2 \\
2x \cdot 3 &= 6x \\
-3 \cdot 2x &= -6x \\
-3 \cdot 3 &= -9 \\
4x^2 + 6x - 6x - 9 &= 4x^2 - 9 \\
\end{align*}
\]

Multiply the First addends.  
Multiply the Outer addends.  
Multiply the Inner addends.  
Multiply the Last addends.  
Add the products.  
Combine the like terms.

Solution: The simplified form of \((2x - 3)(2x + 3)\) is \(4x^2 - 9\).

**Exercises**

Simplify each product.

13. \((p - 4)(p + 4)\)  
14. \((q + 5)(q - 5)\)  
15. \((3r + 2)(3r - 2)\)
16. \((4x - 6)(4x + 6)\)  
17. \((2t - 1)(2t + 1)\)  
18. \((5u - 3)(5u + 3)\)
19. \((6y - 4)(6y + 4)\)  
20. \((3w - 8)(3w + 8)\)  
21. \((7x - 9)(7x + 9)\)
Activity: Special Cases
Multiplying Special Case Binomials

This is an activity for two students. Use the following three products involving squares.

\[(a + b)^2 = a^2 + 2ab + b^2\]
\[(a - b)^2 = a^2 - 2ab + b^2\]
\[(a + b)(a - b) = a^2 - b^2\]

Make ten cards by cutting out the boxes below. Turn the cards face down, and then shuffle them. Take turns choosing a card from the pile. On the blank side of the card, write a shortcut for multiplying the factors. Time each other to see who can find the fastest product using the shortcuts.

For example, for the product \(78 \times 78\), you could write:
\[78 \times 78 = (80 - 2)^2 = 80^2 - 2(80)(2) + 2^2 = 6400 - 320 + 4 = 6084\]

1. \(83 \times 83\)
2. \(63 \times 57\)
3. \(59 \times 59\)
4. \(75 \times 65\)
5. \(92 \times 88\)
6. \(85 \times 85\)
7. \(71 \times 71\)
8. \(101 \times 99\)
9. \(62 \times 58\)
10. \(206 \times 194\)
Think About a Plan
Multiplying Special Cases

Construction A square deck has a side length of \( x + 5 \). You are expanding the deck so that each side is four times as long as the side length of the original deck. What is the area of the new deck? Write your answer in standard form.

Understanding the Problem

1. What is the shape of the deck? ________________________________

2. How long is each side of the deck? ________________________________

3. The new deck has sides that are _______________ times longer than the original sides.

4. What is the problem asking you to find? ________________________________

Planning the Solution

5. Write an expression for the new side length of the deck.

6. Write an expression for the area of the new deck.

Getting an Answer

7. What is the standard form of the expression for the area of the new deck?
Simplify each expression.

1. \((x + 7)^2\)  
2. \((w + 9)^2\)  
3. \((h + 3)^2\)  
4. \((2s + 4)^2\)  
5. \((3s + 1)^2\)  
6. \((5s + 2)^2\)  
7. \((a - 5)^2\)  
8. \((k - 10)^2\)  
9. \((n - 4)^2\)  
10. \((3m - 4)^2\)  
11. \((6m - 2)^2\)  
12. \((4m - 2)^2\)

The figures below are squares. Find an expression for the area of each shaded region. Write your answers in standard form.

13.  
14.  

15.  
16.  

17. A square brown tarp has a square green patch green in the corner. The side length of the tarp is \((x + 8)\) and the side length of the patch is \(x\). What is the area of the brown part of the tarp?

18. A square red placemat has a gold square in the center. The side length of the gold square is \((x - 2)\) inches and the width of the red region is 4 inches. What is the area of the red part of the placemat?
8-4 Practice (continued)

Multiplying Special Cases

**Mental Math Simplify each product.**

8-5 Reteaching

Factoring $x^2 + bx + c$

If a trinomial of the form $x^2 + bx + c$ can be written as the product of two binomials, then:

- The coefficient of the $x$-term in the trinomial is the sum of the constants in the binomials.
- The trinomial’s constant term is the product of the constants in the binomials.

**Problem**

What is the factored form of $x^2 + 12x + 32$?

To write the factored form, you are looking for two factors of 32 that have a sum of 12.

**Solve**

Make a table showing the factors of 32.

<table>
<thead>
<tr>
<th>Factors of 32</th>
<th>Sum of Factors</th>
</tr>
</thead>
<tbody>
<tr>
<td>1 and 32</td>
<td>33</td>
</tr>
<tr>
<td>2 and 16</td>
<td>18</td>
</tr>
<tr>
<td>4 and 8</td>
<td>12</td>
</tr>
</tbody>
</table>

$x^2 + 12x + 32 = (x + 4)(x + 8)$

**Check**

$(x + 4)(x + 8)$

$x^2 + 8x + 4x + 32$ Use FOIL Method.

$x^2 + 12x + 32$ Combine the like terms.

Solution: The factored form of $x^2 + 12x + 32$ is $(x + 4)(x + 8)$.

**Exercises**

Factor each expression.

1. $x^2 + 9x + 20$
2. $y^2 + 12y + 35$
3. $z^2 + 8z + 15$
4. $a^2 + 11a + 28$
5. $b^2 + 10b + 16$
6. $c^2 + 12c + 27$
7. $d^2 + 6d + 5$
8. $e^2 + 15e + 54$
9. $f^2 + 11f + 24$
8-5 \hspace{1cm} \textbf{Reteaching} \hspace{1cm} (continued)

\textbf{Factoring} \ x^2 + bx + c

Some factorable trinomials in the form of \(x^2 + bx + c\) will have negative coefficients. The rules for factoring are the same as when the \(x\)-term and the constant are positive.

\begin{itemize}
  \item The coefficient of the \(x\)-term of the trinomial is the sum of the constants in the binomials.
  \item The trinomial's constant term is the product of the constants in the binomials.
\end{itemize}

However, one or both constants in the binomial factors will be negative.

\textbf{Problem}

What is the factored form of \(x^2 - 3x - 40\)?

To write the factored form, you are looking for two factors of \(-40\) that have a sum of \(-3\). The negative constant will have a greater absolute value than the positive constant.

\textbf{Solve} \hspace{1cm} Make a table showing the factors of \(-40\).

\begin{center}
\begin{tabular}{|c|c|}
\hline
Factors of \(-40\) & Sum of Factors \\
\hline
1 and \(-40\) & \(-39\) \\
2 and \(-20\) & \(-18\) \\
4 and \(-10\) & \(-6\) \\
5 and \(-8\) & \(-3\) \\
\hline
\end{tabular}
\end{center}

\(x^2 - 3x - 40 = (x - 8)(x + 5)\)

\textbf{Check}

\begin{align*}
(x - 8)(x + 5) & \quad \text{Use FOIL Method.} \\
x^2 + 5x - 8x - 40 & \quad \text{Combine the like terms.} \\
x^2 + (-3x) - 40 & \quad \text{Solution: The factored form of } x^2 - 3x - 40 \text{ is } (x - 8)(x + 5).\]
\end{align*}

35. **Reasoning** Write possible expressions for the length and the width of a rectangle with area \(x^2 + 13x + 42\).

36. A rectangular tabletop has an area of \(t^2 + 2t + 99\). What are possible dimensions of the tabletop? Use factoring.
8-5

**Enrichment**

Factoring \( x^2 + bx + c \)

To factor a trinomial of the form \( x^2 + bx + c \) as the product of binomials, you must find factor pairs that have a sum of \( b \) and a product of \( c \). Examine what happens to \( c \) as you increase \( b \) when \( c \) is greater than zero.

If \( b = 2 \), the factor pair is \( 1, 1 \) and the product is \( 1 \). \((x + 1)(x + 1) = x^2 + 2x + 1\)

If \( b = 3 \), the factor pair is \( 1, 2 \) and the product is \( 2 \). \((x + 1)(x + 2) = x^2 + 3x + 2\)

If \( b = 4 \), the factor pairs are \( 1, 3 \) and \( 2, 2 \). The products are \( 3 \) and \( 4 \).

\[(x + 1)(x + 3) = x^2 + 4x + 3\]
\[(x + 2)(x + 2) = x^2 + 4x + 4\]

If \( b = 5 \), the factor pairs are \( 1, 4 \) and \( 2, 3 \). The products are \( 4 \) and \( 6 \).

\[(x + 1)(x + 4) = x^2 + 5x + 4\]
\[(x + 2)(x + 3) = x^2 + 5x + 6\]

1. What are the factor pairs and products (values of \( c \)) for the following values of \( b \), for \( x^2 + bx + c \) if \( c > 0 \)?

\[
\begin{align*}
&b = 6 & b = 7 & b = 8 & b = 9 & b = 10 \\
&\text{ } & \text{ } & \text{ } & \text{ } & \text{ }
\end{align*}
\]

2. What pattern do you see in the number of factor pairs (and thus values for \( c \)) as you increase the value of \( b \)?

3. Describe at least one pattern you see in the value of \( c \) in terms of \( b \).

Now examine what happens to the value of \( b \) when the value of \( c \) changes, when \( c > 0 \).

If \( c = 1 \), the factor pair is \( 1, 1 \), and the sum is \( 2 \). \((x + 1)(x + 1) = x^2 + 2x + 1\)

If \( c = 2 \), the factor pair is \( 1, 2 \) and the sum is \( 3 \). \((x + 1)(x + 2) = x^2 + 3x + 2\)

If \( c = 3 \), the factor pair is \( 1, 3 \) and the sum is \( 4 \). \((x + 1)(x + 3) = x^2 + 4x + 3\)

If \( c = 4 \), the factors pairs are \( 1, 4 \) and \( 2, 2 \). The sums are \( 5 \) and \( 4 \).

\[
\begin{align*}
&(x + 1)(x + 4) = x^2 + 5x + 4 & (x + 2)(x + 2) = x^2 + 4x + 4 \\
&\text{ } & \text{ }
\end{align*}
\]

4. What are the factor pairs and sums (values of \( b \)) for the following values of \( c \), for \( x^2 + bx + c \) if \( c > 0 \)?

\[
\begin{align*}
&c = 5 & c = 6 & c = 7 & c = 8 \\
&\text{ } & \text{ } & \text{ } & \text{ }
\end{align*}
\]

5. Describe at least one pattern you see in the value of \( b \) in terms of \( c \). Explain why this might be.
A student is trying to factor $3x^2 + 13x + 4$. She wrote these steps to solve the problem on note cards, but they got mixed up.

Find factors of $ac$ that have sum $b$.

$(3x + 1)(x + 4)$

Since $ac = 12$ and $b = 13$, find positive factors of 12 that have sum 13.

To factor the trinomial, use the factors you found to rewrite $bx$ as $1x + 12x$.

Make a table.

<table>
<thead>
<tr>
<th>Factors of 12</th>
<th>2, 6</th>
<th>3, 4</th>
<th>1, 12</th>
</tr>
</thead>
<tbody>
<tr>
<td>Sum of factors</td>

Reteaching
Factoring \(ax^2 + bx + c\)

You can use your knowledge of prime numbers to help you factor some trinomials as two binomials. A prime number has only 1 and itself as factors. For trinomials of the form \(ax^2 + bx + c\), if \(a\) is a prime number then you already know the first term of each binomial: \(ax\) and \(1x\). Then list the factors that will multiply to produce \(c\). Use guess and check to find the factor pair that will add to \(b\).

**Problem**

What is the factored form of \(7x^2 + 31x + 12\)?

\[
7x^2 + 31x + 12 = (7x \quad )(1x \quad )
\]

- \(a\) is 7, which is prime, so the factors are 7 and 1.
- You don't need the 1 in front of the variable, so drop it.
- The trinomial has two plus signs, so the binomials also have plus signs.

Because \(c\) is 12, find factor pairs that multiply to 12: (1 and 12), (2 and 6), (3 and 4).

Try each pair in the expression to see if the INNER and OUTER products add to \(b\), or 31.

- \((7x + 1)(x + 12) = 7x^2 + x + 84x = 7x^2 + 85x + 12 \quad \text{(NO)}\)
- \((7x + 2)(x + 6) = 7x^2 + 2x + 42x = 7x^2 + 44x + 12 \quad \text{(NO)}\)
- \((7x + 3)(x + 4) = 7x^2 + 3x + 28x = 7x^2 + 31x + 12 \quad \text{(YES)}\)

The factored form of \(7x^2 + 31x + 12\) is \((7x + 3)(x + 4)\).

**Exercises**

Factor each expression.

1. \(3x^2 + 14x + 8\)
2. \(5y^2 + 43y + 24\)
3. \(2z^2 + 19z + 42\)
4. \(11a^2 + 39a + 18\)
5. \(13b^2 + 58b + 24\)
6. \(23c^2 + 56c + 20\)
7. \(7d^2 + 6d + 8\)
8. \(3e^2 + 20e - 32\)
9. \(19f^2 + 10f - 9\)
10. \(5s^2 - 18s + 16\)
11. \(17f^2 - 12f - 5\)
12. \(29u^2 + 48u - 20\)
Reteaching (continued)

Factoring $ax^2 + bx + c$

If you are given the area and one side of a rectangle, you can find the second side by factoring the trinomial. One binomial is the width and the other binomial is the length.

Problem

The area of a rectangular swimming pool is $6x^2 + 11x + 3$. The width of the pool is $2x + 3$. What is the length of the pool?

You are given the area and length of the pool. Set up an equation with what you are given and solve for length.

\[
6x^2 + 11x + 3 = (2x + 3)(\square \square \square)
\]

\[
6x^2 + 11x + 3 = (2x + 3)(3x \square \square)
\]

\[
6x^2 + 11x + 3 = (2x + 3)(3x + \square)
\]

\[
6x^2 + 11x + 3 = (2x + 3)(3x + 1)
\]

Area = length \times width.

$6x^2 = (2x)(3x)$, so the first term of the second binomial is $3x$.

The trinomial has two plus signs, so the sign for the second binomial must also be plus. The value of $c$ is $3$. Since $3 = 3 \times 1$, the second term must be $1$.

Multiply to check your answer. Use FOIL.

\[
(2x + 3)(3x + 1) = 6x^2 + 2x + 9x + 3 = 6x^2 + 11x + 3 \checkmark
\]

The length of the swimming pool is $3x + 1$.

21. $24a^2 + \square a + 15$
22. $18b^2 + \square b + 8$

23. A parallelogram has an area of $8x^2 + 2x - 45$. The height of the parallelogram is $4x + 9$.
   a. Write the formula for the area of a parallelogram.
   b. What is the length of the base of the parallelogram?
   c. Writing Explain how you solved the problem.

24. A rectangular athletic field has an area of $40x^2 + 190x + 50$. The width of the athletic field is $8x + 2$. What is the length of the athletic field?

Factor each expression.

25. $96d^2 - 76d - 77$
26. $48h^2 - 86h + 35$

27. $24m^2 + 18m - 15$
28. $36c^2 + 27c - 55$
You can use a function to estimate the volume of an adult body based on the length of one part, such as the length of an index finger, $x$. Start by using $x$ to calculate the volume of an index finger. Assume the ratio of the length to height to width of an average index finger is $7:1:2$. Therefore, the volume is $\frac{27}{49} x^3$.

You can then estimate that approximately 10 index fingers make up one hand. Multiply the volume of one index finger by 10 to find the volume in one hand: $\frac{20}{49} x^3$. Use this more convenient hand measure to figure out how many hands make up each large body area.

Hand $\approx 1$ hand
Torso $\approx 100$ hands
Arm $\approx 12$ hands
Leg $\approx 45$ hands
Head $\approx 12$ hands
Foot $\approx 3$ hands
Neck $\approx 8$ hands

Add up all the parts, making sure to double the hands, arms, and legs:
$2 + 24 + 12 + 8 + 100 + 90 + 6 = 242$ hands

Now multiply the number of hands by the volume in one hand:
$242 \left( \frac{20}{49} \right) x^3 = \frac{4840}{49} x^3 = \frac{338}{49} x^3$

Now that you have a function for the volume of a human body, you can use it to find expressions for other body parts without measuring.

1. Use the function $V = \frac{338}{49} x^3$, the volume of an adult body to write an expression for the length of the foot in an adult body, where the ratio of the length to height to width of the foot is $6:1:1$.

2. Use the same function to write an expression for the length of an arm in an adult body where the ratio of the length to height to width of the arm is $10:1:1$.

3. Measure the lengths of three people’s index fingers, feet, and arms. How do the results compare to your estimates?
Complete the vocabulary chart by filling in the missing information.

\textbf{Reteaching}  
\textit{Factoring Special Cases.}

The area of a square is given by \( A = s^2 \), where \( s \) is a side length. When the side length is a binomial, the area can be written as a perfect-square trinomial. If you are given the area of such a square, you can use factoring to write an expression for a side length.

\begin{align*}
\text{Problem} \\
\text{A mosaic is made of small square tiles called tesserae. Suppose the area of one tessera is } 9x^2 + 12x + 4. \text{ What is the length of one side of a tessera?} \\
\text{Because the tile is a square, you know the side lengths must be equal. Therefore, the binomial factors of the trinomial must be equal.} \\
x^2 + 12x + 4 &= (\_\_\_)^2 \\
9x^2 &= (3x)^2 \\
4 &= 2^2 \\
2(3x)(2) &= 12x \\
9x^2 + 12x + 4 &= (3x + 2)^2
\end{align*}

This is a perfect square trinomial and can be factored as the square of a binomial.

\( 9x^2 \) and \( 4 \) are perfect squares. Write them as squares.

Check that \( 12x \) is twice the product of the first and last terms. It is, so you are sure that you have a perfect-square trinomial.

Rewrite the equation as the square of a binomial.

Multiply to check your answer.

\( (3x + 2)(3x + 2) = 9x^2 + 6x + 6x + 4 = 9x^2 + 12x + 4 \)

The length of one side of the square is \( 3x + 2 \).

\textbf{Exercises}  
\textit{Factor each expression to find the side length.}

1. The area of a square oil painting is \( 4x^2 + 28x + 49 \). What is the length of one side of the painting?

2. You are installing linoleum squares in your kitchen. The area of each linoleum square is \( 16x^2 - 24x + 9 \). What is the length of one side of a linoleum square?

3. You are building a table with a circular top. The area of the tabletop is \( (25x^2 - 40x + 16)\pi \). What is the radius of the tabletop?

4. A fabric designer is making a checked pattern. Each square in the pattern has an area of \( x^2 - 16x + 64 \). What is the length of one side of a check?
Some binomials are a difference of two squares. To factor these expressions, write the factors so the \(x\)-terms cancel and you are left with two perfect squares.

### Problem

What is the factored form of \(4x^2 - 9\)?

\[
4x^2 - 9 = (\Box + \Box)(\Box - \Box)
\]

Both \(4x^2\) and \(9\) are perfect squares. You know the signs of the factors will be opposite, so the \(x\)-terms will cancel out.

1. Find the square root of each term.

\[
\sqrt{4x^2} = 2x
\]

\[
\sqrt{9} = 3
\]

\[
(2x + 3)(2x - 3)
\]

Write each term as a binomial with opposite signs, so the \(x\)-terms will cancel out.

Multiply to check your answer.

\[
(2x + 3)(2x - 3) = 4x^2 + 6x - 6x - 9
\]

\[
= 4x^2 - 9 \checkmark
\]

The factored form of \(4x^2 - 9\) is \((2x + 3)(2x - 3)\).

### Exercises

Factor each expression.

5. \(9x^2 - 4\)

6. \(25x^2 - 49\)

7. \(144x^2 - 1\)

10. \(36x^2 - 49\)

11. \(81x^2 - 16\)

12. \(16x^2 - 121\)

13. \(25x^2 - 144\)

14. \(16x^2 - 9\)

15. \(x^2 - 81\)

16. \(4x^2 - 49\)
Activity: Grid-Paper Factoring

Factoring Special Cases

You can solve factoring problems with paper and scissors.

What is the area of the lightly shaded parts in the grid at the right in terms of 20 and 12?

- Use the graph paper to draw a square 20 units by 20 units and, inside it, a square 12 units by 12 units.
- Cut out the three lightly shaded regions and the darkly shaded region. Put the darkly shaded region aside.
- Tape the three remaining shapes together to form a single rectangle like the one below. Be sure to label your figure.

- Write expressions for the length and width of this rectangle in terms of 20 and 12.

- Use the formula for the area of a rectangle to find the area of the three combined rectangles.

- On a separate piece of grid paper (units must be the same size as the one used above), cut out a rectangle whose length is $20 + 12$ units and whose width is $20 - 12$ units. Use the formula for the area of a rectangle to find the area of this rectangle.

- How does this expression relate to the expression you wrote for the area of the lightly shaded region?
Think About a Plan

Factoring Special Cases

**Interior Design** A square rug has an area of $49x^2 - 56x + 16$. A second square rug has an area of $16x^2 + 24x + 9$. What is an expression that represents the difference of the areas of the rugs? Show two different ways to find the solution.

1. What are two methods you could use to solve this problem? __________

2. How would you find the difference without factoring? __________

3. What polynomial do you get when you use this method? __________

4. Can you factor that polynomial? __________

5. How could you use factoring to solve the problem? __________

6. What do the shape of the rug and the polynomials tell you about how to factor the polynomials for the area of the rugs? __________

7. Factor each trinomial.
   
   $49x^2 - 56x + 16 = (☐ - ☐)(☐ - ☐) = (☐☐☐)^2$
   
   $16x^2 + 24x + 9 = (☐ + ☐)(☐ + ☐) = (☐☐☐)^2$

8. Use your results from Exercise 7 to write an expression for the difference in the areas.

9. Factor the expression from Exercise 8 using the difference of two squares. Simplify the expressions within each set of parentheses.

10. Do the two methods give you the same result?
8-7 Practice

Mental Math For Exercises 32–34, find a pair of factors for each number by using the difference of two squares.

32. 84
33. 55
34. 80

35. Writing The area of a square painting is \( 225x^4 + 240x^2 + 64 \). Explain how you would find a possible length of one side of the painting.
The surface area of a cube is determined by the formula \( SA = 6s^2 \), where \( s \) is the length of a side of the cube. You can use this formula to analyze a polynomial that represents the surface area of a cube.

Start by dividing the polynomial by 6. This will leave an expression for the area of one face of the cube. You can see that the area is a perfect-square trinomial. Reverse the rules for multiplying squares of binomials to factor the trinomial.

For example, a cube with a surface area of \( 24x^2 + 24x + 6 \) has a side measure of \( 2x + 1 \).

\[
6s^2 = 24x^2 + 24x + 6 \\
\frac{s^2}{6} = \frac{24x^2 + 24x + 6}{6} = 4x^2 + 4x + 1 \\
s = \sqrt{4x^2 + 4x + 1} \\
\]

The surface area of a rectangular prism with two square faces is determined by the formula \( SA = 4ls + 2s^2 \), where \( l \) is the length and \( s \) is the measure of the side of the square face. If you are given the surface area and the area of the square face, you can determine the dimensions of the rectangular prism.

Suppose a rectangular prism has a surface area of \( 24x + 30 \) and each square face measures 9 cm².

\[
24x + 30 - 18 = 24x + 12 \\
\frac{24x + 12}{4} = 6x + 3 \quad \text{Divide by 4 to get the area of each remaining side.} \\
\frac{6x + 3}{3} = 2x + 1 \quad \text{Divide by the side length of the square base, or the square root of the base's area.}
\]

1. The surface area of a cube is \( 96x^2 + 144x + 54 \). What is the measure of each side?

2. The surface area of a cube is \( 54x^2 - 36x + 6 \). What is the measure of each side?

3. The surface area of a cube is \( 864x^2 + 720x + 150 \). What is the measure of each side?

4. The surface area of a rectangular prism is \( 100x + 90 \). The areas of the two square faces of the prism are 25 m² each. What are the dimensions of the rectangular prism?

5. The surface area of a rectangular prism is \( 2x^2 + 48x + 88 \). The areas of the two square faces of the prism are \( x^2 + 4x + 4 \) each. What are the dimensions of the rectangular prism?
Use the list to complete the diagram.

Steps for Factoring a Polynomial Completely

1. Factor out the _____.

2. If the polynomial has two or three terms, look for a difference of two ____________, a perfect-square trinomial, or a _____________.

3. If the polynomial has four or more terms, group terms and ________ to find common binomial factors.

4. Make sure there are no ____________ other than 1.
Reteaching
Factoring by Grouping

You can factor some higher-degree polynomials by grouping terms and factoring out the GCF to find the common binomial factor. Make sure to factor out a common GCF from all terms first before grouping.

**Problem**

What is the factored form of \(2b^4 - 8b^3 + 10b^2 - 40b\)?

\[
2b^4 - 8b^3 + 10b^2 - 40b = 2b(b^3 - 4b^2 + 5b - 20)
\]

\[
= 2b[(b - 4) + 5(b - 4)]
\]

\[
= 2b(b^2 + 5)(b - 4)
\]

\(2b\) is the GCF of all four terms. Factor out \(2b\) from each term.

Group terms into pairs and look for the GCF of each pair. \(b^2\) is the GCF of the first pair, and 5 is the GCF of the second pair.

\(b - 4\) is the common binomial factor.

Use the Distributive Property to rewrite the expression.

Multiply to check your answer.

\[
2b(b^2 + 5)(b - 4) = 2b(b^3 + 5b^2 - 4b^2 - 20b)
\]

\[
= 2b^4 + 10b^3 - 8b^3 - 40b
\]

\[
= 2b^4 - 8b^3 + 10b^2 - 40b
\]

Multiply \(b^2 + 5\) and \(b - 4\).

Multiply by \(2b\).

Reorder the terms by degree.

The factored form of \(2b^4 - 8b^3 + 10b^2 - 40b\) is \(2b(b^2 + 5)(b - 4)\).

**Exercises**

Factor completely. Show your steps.

1. \(4x^4 + 8x^3 + 12x^2 + 24x\)

2. \(24y^6 + 6y^3 + 36y^3 + 9y\)

3. \(72x^4 + 48x^3 + 126x^2 + 84x\)

9. \(60x^3 - 90x^2 - 30x + 45\)

10. \(12p^5 + 8p^4 + 18p^3 + 12p^2\)

11. \(6r^3 + 9r^2 - 60r\)

12. \(20r^6 - 50r^5 - 30r^4\)
Polynomials can be used to express the volume of a rectangular prism. They can sometimes be factored into 3 expressions to represent possible dimensions of the prism. The three factors are the length, width, and height.

**Problem**

The plastic storage container to the right has a volume of $12x^3 + 8x^2 - 15x$. What linear expressions could represent possible dimensions of the storage container?

$$12x^3 + 8x^2 - 15x = x(12x^2 + 8x - 15)$$

$$= x(12x^2 + 18x - 10x - 15)$$

$$= x[6x(2x + 3) - 5(2x + 3)]$$

$$= x(6x - 5)(2x + 3)$$

Factor out $x$, the GCF for all three terms. $ac = -180$ and $b = 8$. Break $8x$ into two terms that have a sum of $8x$ and a product of $-180x^2$.

Group the terms into pairs and factor out the GCF from each pair. The GCF of the first pair is $6x$. The GCF of the second pair is $-5$.

$2x + 3$ is the common binomial term. Use the Distributive Property to reorganize the factors.

Multiply to check your answer.

$$x(6x - 5)(2x + 3) = x(12x^2 + 18x - 10x - 15)$$

$$= x(12x^2 + 8x - 15)$$

$$= 12x^3 + 8x^2 - 15x$$

Possible dimensions of the storage container are $x$, $6x - 5$, and $2x + 3$.

**Exercises**

Find linear expressions for the possible dimensions of each rectangular prism.

13. $V = 12x^3 + 34x^2 + 14x$

14. $V = 10x^3 + 65x^2 + 105x$

15. $V = 60x^3 - 68x^2 - 16x$

16. $V = 12x^3 - 15x^2 - 18x$
Think About a Plan
Factoring by Grouping

Art  The pedestal of a sculpture is a rectangular prism with a volume of $63x^3 - 28x$. What expressions can represent the dimensions of the pedestal? Use factoring.

Know

1. The pedestal of the sculpture is shaped like a ________________________________.

2. The volume of the pedestal is ____________.

3. The formula you can use to find the dimensions of the pedestal is. ____________.

Need

4. To solve the problem you need to find _______________________________________________________________________

______________________________________________________________________________

Plan

5. Factor out the GCF from the volume of the pedestal. ________________________________

6. What type of expression is the remaining expression? ________________________________

7. Factor the expression completely. ________________________________

8. What expressions represent possible dimensions of the pedestal?
______________________________________________________________________________
Practice

Factoring by Grouping

Find the GCF of the first two terms and the GCF of the last two terms for each polynomial.

1. $12x^3 + 3x^2 + 20x + 5$
2. $6y^3 + 42y^2 + 5y + 35$
3. $8t^3 + 36t^2 + 2t + 9$
4. $10s^3 + 35s^2 + 6s + 21$
5. $9m^3 - 6mr + 12m - 8$
6. $8n^3 + 6n^2 - 28n - 21$
7. $7r^3 + 16r^2 - 9r - 72$
8. $21x^3 - 28x^2 - 6x + 8$

Factor each expression.

9. $8j^3 + 4j^2 + 10j + 5$
10. $2m^3 + 8m^2 + 9m + 36$

30. Writing Describe the first step to look for in factoring a cubic expression containing four terms.

31. Open-Ended Write a 4-term expression that you can factor by grouping. Factor your polynomial.
Enrichment
Factoring by Grouping

Pascal’s triangle is named after French mathematician Blaise Pascal, but this special number pattern had been studied in India, China, Persia, and Italy long before Pascal. To generate Pascal’s triangle, start with the number 1 in Row 0. Each successive row has a 1 at both ends. Add the numbers directly above-left and above-right to find the new value.

<table>
<thead>
<tr>
<th>Row 0</th>
<th>1</th>
</tr>
</thead>
<tbody>
<tr>
<td>Row 1</td>
<td>1 1</td>
</tr>
<tr>
<td>Row 2</td>
<td>1 2 1</td>
</tr>
<tr>
<td>Row 3</td>
<td>1 3 3 1</td>
</tr>
<tr>
<td>Row 4</td>
<td>1 4 6 4 1</td>
</tr>
<tr>
<td>Row 5</td>
<td>1 5 10 10 5 1</td>
</tr>
<tr>
<td>Row 6</td>
<td>1 6 15 20 15 6 1</td>
</tr>
<tr>
<td>Row 7</td>
<td>1 7 21 35 35 21 7 1</td>
</tr>
<tr>
<td>Row 8</td>
<td>1 8 28 56 70 56 28 8 1</td>
</tr>
</tbody>
</table>

You can use Pascal’s triangle to quickly expand a binomial expression. The exponent tells you the row number to choose. The numbers in the correct row are the coefficients to use in the expansion.

To expand \((a + b)^4\), look to Row 4. The coefficients are 1, 4, 6, 4, 1. Expand the variables, raising the first variable to 4 and decreasing by one for each term. Raise the second variable to 0 and increase by 1 at each new term. Multiply each term by the coefficients:

\[ a^4 + 4a^3b + 6a^2b^2 + 4ab^3 + b^4. \]

You can also use Pascal’s triangle to factor polynomials that are expansions of binomial expressions. Arrange the polynomial in standard form. Check to see if the coefficients correspond to a row in Pascal’s triangle. Work backwards to factor.

To factor \(15xy^2 - y^3 + 125x^3 - 75x^2y\), first rearrange the terms in standard form:

\(125x^3 - 75x^2y + 15xy^2 - y^3\). In expansions of binomial expressions the x-exponents decrease by one in every term and y-exponents increase by one. Since the first and last terms have exponents of 3, the binomial is raised to the third power. Find the cube root of 125 to find the coefficient of x: 5. The final term is negative and has a coefficient of one, so the expression is \((5x - y)^3\). Expand the binomial to check your answer:

\[(5x - y)^3 = 1(5x)^3 + 3(5x)^2(-y) + 3(5x)(-y)^2 + (-y)^3 = 125x^3 - 75x^2y + 15xy^2 - y^3\]

Expand the binomial using Pascal’s triangle.

1. \((4k + j)^4\)
2. \((7x - y)^7\)

Factor the polynomial using Pascal’s triangle. Then expand the binomial to check your answer.

3. \(8a^3 + 12a^2b + 6ab^2 + b^3\)
4. \(40x^3y^3 + 32x^5 + 10xy^4 + 80x^4y + y^5 + 80x^3y^2\)
5. \(1215x^3y^3 + 135x^2y^4 + 729x^6 + 18xy^5 + y^6 + 1458x^5y + 540x^3y^4\)
